

DedicatusIT Service Delivery Operating System

The Service Doctrine — how we deliver a world-class remote dedicated-technician service. The single frame the playbook and the app encode.

The spine

We sell one named person, embedded in an MSP, who becomes “part of their team.” The value isn’t volume — it’s fit, continuity and trust. We have two customers who can quietly pull apart: the MSP and the technician. Our entire job is to make the MSP never want to do it without us — not by out-scaling ConnectWise’s transactional offering, but by out-*caring* it, and making that care a reliable system rather than a personality trait.

THE GOVERNING ETHIC — over every pillar below

Never go red in the tech’s mind. Care, not surveillance. The technician was hired for a job description; everything we ask beyond it — documentation, prompts, teaching — must land as investment in *them*, never as extraction or a step toward replacing them. The same artifact can read as “we’re building your replacement manual” or “we’re making sure you can take a real holiday and look like a pro.” We relentlessly deliver the second. This ethic decides the wording of every prompt, the reason we give for every ask, and the wall between what the tech owns and what stays our private view.

The service is two halves held in three domains. **Find & Build** supplies the people and starts them well. **Care & Keep** tends the living relationship. **Grow & Run** expands and operates the business. Eight pillars sit underneath; the ethic sits over all of them.

DOMAIN 1

FIND & BUILD

Supply: the people, and the strong start.

Right fit, strong start

The seat is defined with the MSP, the person is matched for fit and temperament — not just skills — and the first 30/60/90 days are deliberate. Embedded roles live or die on fit; most failures are baked in here. Get this right and everything downstream is easier.

The bench & training pipeline

We recruit, vet and train ahead of need, so we can say yes to a new seat in days and absorb a departure without panic. A delivery service is only as strong as its supply of ready people. Training is central and compounding: techs author reusable modules as they grow, and those modules feed a central DedicatusIT library that onboards the next person faster. (See “Training as a compounding asset,” below — it is the engine of this pillar and threads several others.)

DOMAIN 2

CARE & KEEP

The relationship: tending what already exists.

Two-sided care

We continuously tend both the MSP relationship and the technician’s wellbeing, and we see the gap between them before it becomes a resignation. The tech is someone we look after, never a resource we monitor. This is the heart of the service and the thing a staffing platform structurally cannot do.

A shared system around the seat

What a direct hire can't give the MSP is not a free spare person — it's a shared system the seat plugs into, none of which is a second paid head: an **escalation / second-brain network** (the tech can reach a senior peer or the founder when stuck — shared across all techs, so it costs nothing per seat), a **quality and worknote standard** the tech is held to, a **relationship owner** (the SDM) accountable for the whole arrangement, and a **continuity promise** — if the tech leaves, it's our problem to absorb, not the MSP's. Coverage for leave and sickness is a real future capability, but it arrives with the bench — it is never two techs against one invoice.

Grow the person, build belonging

Development, recognition, and a genuine sense that DedicatusIT is the tech's home — not a payroll company. This is the retention moat, and it's the soil that makes any above-and-beyond ask feel like status rather than a demand. Being asked to teach or to mentor is a promotion in disguise — the exact opposite of insecurity.

Continuity without fear

Knowledge capture, relief readiness and a calm transition playbook — the MSP's deepest worry ("what if they leave and the knowledge walks out?") answered. Built *with* the tech as their own safety net so leave is actually restful and they're never the fragile single point of failure — never framed as a replacement manual. Crucially, the tech-authored training modules *are* continuity artifacts in a form that feels like teaching, not documenting-yourself-out-of-a-job.

DOMAIN 3

GROW & RUN

The business: expand the accounts, run the machine.

The commercial engine

Deliberate expansion from one seat to many, renewal protection, and clean handling of pricing and scope changes. Every MSP should grow past a single seat; healthy accounts become growing ones through the cadence and the QBR, where expansion signals are heard and acted on.

The operational backbone

The reliable machinery of a remote service: access and security done right, crisp onboarding and offboarding, the India–US time-zone handoff, tooling, and data protection. This is what makes DedicatusIT look like an institution rather than an improvisation — and it, too, must touch the tech gently.

Training as a compounding asset

This deserves its own statement because it is where the ethic, the bench, growth and continuity all meet. The model: **techs author reusable training modules as they grow, and those modules feed a central DedicatusIT library**. It solves four problems at once, and gently:

- **Bench & scale** — every module is onboarding material for the next hire, so the pipeline gets faster and cheaper to spin up.
- **Growth & belonging** — being asked to teach treats the tech as an expert worth learning from. Status, not surveillance.
- **Continuity** — a module on “how this client's environment works” is a backfill artifact, captured as teaching rather than as a replacement file.
- **An owned moat** — a staffing company owns nothing; its value walks out every evening. A growing library built by embedded experts is an asset that compounds and that ConnectWise's transactional model won't replicate.

The framing rule: “document everything you know so we can replace you” is a threat; “you're senior enough to teach the next person — build a module” is a promotion. Same knowledge captured, opposite emotional result. This is the cleanest expression of the governing ethic in the whole system.

The wall: what the tech owns vs what stays internal

The insecurity principle is enforced by a deliberate boundary. The technician **sees and owns** their pack, their modules and their growth — their professional toolkit, framed as their strength. The **readiness score, the two-sided health dots, and the attention-sorting stay the SDM's private management instruments**. Same underlying data, two audiences: the tech experiences care and ownership; the SDM privately gets assurance. Nothing hidden from the tech is a fact *about* them that would feel like a secret if discovered — only the management view is internal.

What this means for the OS (the app)

The app eventually holds the whole machine — relationship and operation — but is built in phases. The relationship cockpit (Care & Keep) exists today: accounts and seats, two-sided health, structured MSP cadence and tech pulse, the backfill pack with readiness. Next, in service of this doctrine: the cadence becomes **configurable per account** (weekly / bi-weekly / monthly / custom — we meet each MSP's rhythm, not a hard-coded one), with full **manual recording** (log and edit past meetings on any date). The KT prompts get reworded into **the tech's own voice** (“keep your continuity current so leave is restful”). Then the operation pillars arrive: a training-modules library, the commercial/expansion view, and the operational backbone — followed by the backend that gives techs their own gentle, owned login.

In one line: find and start the right people, care for both sides so neither goes red, and grow and run the business around them — always delivering every ask to the tech as investment, never extraction.
